

# Direct and Chairside Composite Resin Restorations – Simplifying Complex Cases and Enhancing Outcomes

A Seminar & Workshop presented by Prof. Ian Meyers

In current dental practice many patients request the use of non-metallic or tooth coloured restorations to restore their teeth. Frequently this provides a challenge to the operator when the restorations are large and access and visibility limited, and the use of complex crown and bridgework may not be an option. This seminar and workshop discuss a range of restorative materials and techniques and will provide participants with a live demonstration for restoring anterior and posterior teeth with composite resin. Direct and indirect chairside techniques will be discussed along with the use of fibre reinforcements to rebuild compromised teeth, and for the construction of resin bonded bridges.

#### Topics to be covered include:

- Case selection and preparation prior to restoration
- Understanding and selecting the appropriate restorative materials
- Adhesion, bonding, bases, linings, and 'sandwich' restorations
- The use of indirect chairside techniques to simplify composite restorations
- The use of fibres to reinforce cracked and compromised teeth
- Construction of fibre reinforced resin bonded bridges
- Finishing, polishing and long term maintenance of restorations
